

As a part of the Department of Orthopaedic Surgery, the main activity of our Laboratory is the locomotor base- and applied research. Our diversified activities can be arranged into four main categories.

(1) orthopaedic and medical device and implant development

(2) biomechanical and other material and structure testing

(3) application of medical 3D technologies

(4) biomechanical and locomotor surgery related base research.

We send off our current renewed homepage with dual goals. First we would like to provide adequate information for those who are interested in the Laboratory, secondly showing our research potential we would like to find more collaboration partners.

Any suggestion and opinion is welcome in our guest book or by using our contact forms in the [Contacts section](#)

.

Yours sincerely

Fejérfalvi Zoltán  
Laboratórium vezetője
